Emergency Protocols

Life Support

Oxygenator

The oxygenator creates breathable oxygen from water. If the main life support systems are down the backup oxygenator can be located in the aft of the ship. Locate the two hoses and place them both in separate containers of water containing exactly 4 units of water.

Ventilation

In order to clear toxic and waste fumes from the ship, locate the spare ventilation fan and place it into the emergency ventilation access point. Plug the fan into a nearby receptacle.

Safety

Defense

In the event normal turret defenses are offline, locate the Arsenal Reserve and distribute weapons to the crewmembers.

Medical Care

The Arsenal Reserve also contains a Trauma Beam. Place the Trauma Beam on a wounded crew member's injury to temporarily treat the damage.

Rescue

Command

The most senior-ranking member of the crew is to assume the position of Acting Captain. The rest of the crew should follow their lead in all situations.

Bridge Access

There are 3 access panels in the aft of the ship. Emergency access to the bridge is granted by the override code entered on all panels simultaneously.

Navigation

When emergency bridge access is granted, the ship will provide a bridge station tutorial hologram to help the emergency crew pilot the ship.

Cargo: Space Measles Vaccine
Origin: New Britain High Command
Destination: Celebration Station
Stardate: 2719/05/19
